

The Sainsbury Laboratory Synbio:  
An international reputation for scientific excellence

The Sainsbury Laboratory which is an independent research institute that focuses on plant health for a sustainable future. Established in 1987, the award winning laboratory makes fundamental scientific discoveries in molecular plant-microbe interactions and applies its research to reduce crop losses caused by plant diseases, particularly in low-income countries. The presentation will high-light the excellence of its scientists and staff and the resulting science that it produces. It will also high-light the fundamental support staff teams, which provide an essential foundation which enable such research goals to be achieved. We will showcase TSL Synbio, a highly utilised support service whose main role is the production, maintenance and distribution of predominantly Golden-Gate constructs and modules not only across the main Norwich Research Park (NRP), but also worldwide under MTA agreements.
